ABSTRACT

The rapid expansion of social media platforms in recent years has completely changed worldwide connectivity and communication. These platforms offer new obstacles in terms of social media crime even as they provide never-before-seen chances for online communication, community building, and information exchange. This abstract summarizes key subjects, trends, and implications while offering an accessible overview of the connection between criminal activity and social media.

The article highlights the advantages of social media, emphasizing how it may help people interact, spread knowledge, and support social activity. Social media platforms function as digital environments where people can express themselves, share personal stories, and assist in the growth of a digital community. However, this portion digs into the multiple drawbacks of social media.

In Open-Source Intelligence (OSINT), data collection and profiling of readily available private and public sources are undertaken. Resources for sector information for business intelligence and personal data. The internet and other social media sites like Facebook, Gmail, Twitter, and What's App, Instagram are some examples of these sources. Although there has been much discussion and investigation about the risks, weaknesses, and effects of using social networking sites, the purpose of this study is to reduce bias.

Objective: To perform a thorough analysis and summary of the results of recent empirical research on open source and cyber intelligence profiling to find online social networks' faults and threats for mitigation targets.

Need and Rationale: Social media emerged as rapidly imposing tools of connection, expression, and dissemination of information. Unfortunately, with this growth came a rush in crime, such as cyberbullying, identity theft, online harassment, misinformation, and financial fraud, through social media. These crimes pose severe dangers to the safety and privacy of individual lives and even put existing legal and regulatory frameworks to test. Urgent analysis of these emerging threats is needed to advance digital literacy, inform policy, and develop effective prevention strategies to enhance safer online environments for all users. This study comes in the face of a need for expediency in balancing great opportunities given by social media with measures that will curtail its fraudulent use or misuse. By explaining the patterns, causes, consequences, and policy gaps regarding crimes in social media, this study aims to add to the safer, ethical, and informed digital environment by its findings. This could direct stakeholders in constructing reasonable policies and awareness campaigns in line with responsible digital citizenship building and reducing online crime.

Methods: A methodical narrative review of the literature based on thorough database searches on the internet. Next, the results were subjected to review using a narrative synthesis technique along with a quantitative and qualitative rating device. Using concepts from articles on "The Effectiveness of Neighborhood Watch," a theoretical framework was developed for the synthesis.

Result: Advancements based on open-source intelligence theories. According to reports, using social media improves peer interaction and expands company potential by facilitating swift consumer information distribution. In the current fight on terror, safe identity experiments, open-source intelligence collection through social media, and online surveillance are particularly important. Recognizing terrorist network structures, mining and analyzing criminal data, and combating improvised explosive devices. The study also emphasized the possible drawbacks and dangers, including identity theft, social networking, and social engineering risks in SNSs (social networking sites). vulnerabilities in the way that cookies and HTTP header data are transmitted to third-party aggregator, in addition to the negative consequences of being exposed to attacks.

Conclusion: The results of the systematic review revealed unexpected results and contradicting theories. Additionally, it has disclosed the spotlighting the research problems that affect open-source intelligence. Social media platforms are constantly used for business, social, and intelligence gathering purposes because social media technologies are invincible. However, to ensure proper and advanced mitigating circumstances, additional research is needed to gain situational awareness and appropriate measures to mitigate them.

• Social media • Social media crimes • OSINT • SOCMINT • Threats • Data privacy • Instagram • Facebook

INTRODUCTION

Everyone in the modern world is familiar with social media. Social media are "forms of electronic communication (such as websites for social networking and micro-blogging) via which users create online communities to share thoughts and views," corresponding to the dictionary by Merriam-Webster. concepts, private communications, and more material (like videos)". There is no need for anything more than an app on your phone to distribute information. Global idea exchange has become faster because of the emergence of this swift medium in our fast-paced environment. Social media has a significant influence on people's lives, both positively and negatively. Since social media is a vital aspect of our lives, it should come as no surprise that illegal conduct on the platform is becoming frequent.[1]

Users of social media now have the opportunity to exchange ideas and material without depending on controlled, traditional news sources. Providing users with the opportunity to communicate with an important

segment of the public and maybe achieving a more balanced distribution of viewpoints.[2]

An examination of social media's positive and negative aspects reveals that, despite all of its benefits, some of its concerns and other adverse effects cannot be neglected. Views and news go throughout social media rapidly. It might lead to instability and social unrest. The discussion of social media has important benefits, but it also needs to be acknowledged that there are risks that should be carefully considered in addition to the platform's many advantages. People are not mature enough to deal with the amount of information that is provided in text messages, Facebook postings, and tweets because they absorb it all without checking its contents, which can be dangerous[3]. Ironically, we have become one of the most antisocial groups yet because of social media. Texting is preferred over phone calls, online chats over physical meetings, and many have completely replaced in-person communication with user-friendly social media sites like Facebook, Twitter, and Instagram. "Every development in social media has made it easier, just a little, to avoid the emotional work of being present, to convey information rather than humanity," said Jonathan Safran Foer in his piece "How Not to Be Alone." The more time goes by, the more accurate these statements become.[4]

Social media was only a service when it first began to take shape in 1997. But it goes beyond than that in the modern era. A social media network by itself is a way for people to interact with one other and share information through virtual communities. It looks like our fake online biodata now. We frequently examine someone's social media profiles after meeting them to find out almost everything about them, including their loves, dislikes, hobbies, and interests. Currently, a number of technologies analyze data and give details about an individual's visual profile through the use of artificial intelligence (AI) and machine learning (ML). This information is crucial for investigators and other individuals charged with gathering intelligence on a user. As worries about privacy increased.[5]

Governments and intelligence organizations use OSINT extensively these days to carry out their investigations and tackle cybercrime. However, it's not the sole application rather than utilized for government matters, but rather for a variety of purposes The current study, which is an expansion of the work suggested in examines the advantages and disadvantages of OSINT, describes applications for this kind of information, and lays out potential prospects for the paradigm's development. This paper also presents a more thorough discussion of various methods, resources, and unresolved issues. In addition, we suggest incorporating OSINT into the DML (Detection Maturity Level) paradigm to tackle the attribution issue in the context of cyberattacks from an alternative angle.[6] SOCMINT (form of OSINT to encounter social media threats) encompasses a wide range of content, including publicly shared Facebook postings, publicly tweeted messages, YouTube videos, and comments on public online newspapers or TV news websites.[7] Due to the fact that SOCMINT is accessible to the general public and is collected in what might be considered a public area, it is frequently lawfully unproblematic to collect and utilize. Thought should still be given to any remaining ethical issues and difficulties. We will introduce and quickly go over the idea of privacy in section. We'll focus on in terms of issues most closely related to SOCMINT in informational privacy.[8] The gathering, review, and use of information from publicly accessible sources for intelligence objectives is known as open-source intelligence, or OSINT. Almost everyone can now access and conduct investigation online thanks to the development of the internet and electronic company websites. Social media platforms have become a crucial open-source strategic tool for businesses to improve communication with their staff and clients. Social intelligence is used to mine Facebook pages and Twitter feeds Instagram feeds/post. One relatively recent cultural shift that appears to have a significant impact on intelligence testing is the manner that information is sent and received.[9]

METHODOLOGY

Data collection method

There are many different reasons why an investigator would want to get data from public sources. Such material could not be accessible through standard closed-source intelligence channels, or it might be needed to provide guidance in the hunt for closed-source intelligence, or it's possible that an investigator turns to open sources to obtain the

same data because they're unwilling to reveal the source of their closed intelligence. In many organizations, the intelligence cycle governs the process of acquiring intelligence. This process proceeds from the identification of the necessary intelligence through the phases of data collection and analysis to the feedback phase, where the intelligence is compared to the initial needs.[10]

I. **Identify Relevant Platforms:** Check which social media sites provide the information you are looking for. Twitter, Facebook, Instagram, Linked-In, Reedit, and other platforms are common ones.[11]
II. **Open-Source Intelligence (OSINT):** Pay attention to data that users voluntarily provide on public profiles and that is accessible to the public. Utilize the highly advanced search features accessible on social media networks to filter results according to keywords, geotags, hashtags, and more parameters.[12]
III. **Web Scraping:** Create or make use of web scraping techniques to get relevant data from social media platforms. Please abide with the terms of service on the website and take care not to take over their servers since this can go against their use guidelines.[13]
IV. **Data Storage:** Set a storage strategy for the gathered data. Using a database system, CSV files, or other storage options may be necessary for this, depending on the amount and format of your data.[14]
V. **Analyze Data:** After collecting the data, use data analysis tools and techniques to extract meaningful insights. Python libraries like Pandas, NumPy, and visualization tools like Matplotlib or Seaborn can be useful.[15]
VI. **Ethical Considerations:** Be careful of user privacy while making sure your data gathering and analysis procedures follow moral standards. Circumscribe from gathering private or sensitive information without permission.[16]

OSINT (open-source intelligence) Tools

Social media platforms for Open-Source Intelligence (OSINT) are becoming increasingly important in the ever-expanding field of information collecting and analysis. These tools are intended to assist people and organizations find important insights by sorting through the massive volumes of publicly available data on social media networks. The following open-source tools are given below in the table 1.[17]

Table 1: Social media detection tool

Input	Description	Tools
Social media handle	Fake account identification	Webmii, Vivial, Upolos
Social media handle	Profile Analysis	Webmii, Rapportive, Vivial, Social Bearing, Tinfoleak
Name	Profile Analysis	Webmii, Maltego, Rapportive, Pipl
Mobile Number	Profile Analysis	Webmii, Maltego, B-Mobile
Email	OSINT Analysis	Searchbug, verify-email, WhatBreach

Social media extremism:

The term "social media extremism" describes the practice of people or organizations using social media platforms to support, encourage, or participate in extreme ideas, viewpoints, or actions. Advocating for opinions that are far off from the majority is known as extremism, and it frequently leads to radicalization into violent or polarizing behavior. Extremists may easily and effectively spread their views, find new followers, and get in touch with like-minded people throughout the world through social media.[18] Social media is becoming more and more involved in the recruitment of violent extremism. Governments are thus creating procedures to scrutinize the recruiting techniques that violent extremists, social media, and online, in order to understand this phenomenon and mitigate its effects. Apart than utilizing conventional methods of observation and enforcement, police are increasingly depending on courteous.[19]

Social media terrorism

Social media is quickly taking over as the most popular means of communication for sharing information both individually and collectively, as more and more people utilize the Internet to express their opinions and exchange information. Further, there are several privacy-related options accessible to users, including "private conversation" and "closed group" on various social media platforms, as well as "open group" or public sites where users may exchange debates and opinions. As a result, it also turned into one of the most effective

and appealing tools for terrorists to acquire new followers and/or stay in constant contact with existing ones, wherever in the globe. Social media and other platforms are used by terrorists and terror groups.[20]

Types of social media crimes commonly faced by the users

I. **Cyber Bullying:** The term "cyberbullying" is often used in both informal and official contexts. The term was first used in 1999, and while definitions vary, they often encompass the use of digital technology to harass or cause persistent damage. Cyberbullying was described as " deliberate and recurrent damage caused through the use of computers, cell phones, or other electronic devices". It was defined as "the use of electronic communication technologies to bully others". in 2014. Many studies have been influenced by the use of various operational definitions, including reported prevalence rates that exhibit significant diversity.[21]

II. **Identity Theft:** It is the common to intentionally misuse someone else's account by logging in, and identity theft wherein fake identities or accounts for the9 only reason imitations are done is to commit fraud. These days, using social media accounts to steal identities is a highly popular and simple technique for crooks. Everyone's practice of using the same password for practically all accounts is primarily to blame for this. If a hacker gains access to your social media accounts, they may quickly obtain your credit card information, bank account information, and online shopping details. They can even utilize your social media accounts for illegal purposes.[22]

III. **Phishing:** One of the worst crimes in the digital age is phishing. It describes an effort to steal private data from a consumer, such credit and debit card numbers. phone numbers, addresses, and email addresses using phony sites, phony websites, or both. Because phishing attempts are becoming more complex in parallel with the growth of online services and Internet technology, these types of crimes pose a danger to Internet security. It is demonstrated in figure.[23]

Figure 1: Phishing analogy

IV. **Online Scams:** social media provides countless avenues for con artists to get customer information and inflict unimaginable harm. various types of social media scams given below:

1. ***Cat fishing:*** Using a false online profile to connect with customers.
2. ***Cash Grabs:*** A fraudster sends an assistance message from a hacked account in order to transfer money.
3. ***Click-bait scam:*** Convince customers to click on the link in order to download malicious software.
4. ***Quiz Scams:*** Phishing personal information through online social media quizzes.
5. ***Scams involving membership:*** To obtain membership.
6. ***Crypto-currency:*** Fake advertisement urging people to buy bit-coin.[24]

V. **Hacking and Unauthorized Access:** Criminals may try to access social media accounts without authorization in order to either steal data or utilize the account adversely. For these kinds of operations, weak passwords, phishing, and other strategies can be used.[25]

VI. **Revenge Pornography:** The word "revenge porn" is commonly used to refer to the non-consensual dissemination of personal photos, as it is often utilized as a form of revenge after a breakup. On the other hand, revenge porn also happens when strangers, family members, coworkers, or classmates disseminate pictures with the intention of intentionally hurting and upsetting the victim. Like other types of sexual harassment, revenge porn mostly affects teenage girls, although men have also fallen victim to it. Photos are often

uploaded to Facebook, Instagram, Twitter, and other social media platforms.[26]

VII. **Social Media/Cyber Stalking:** This type of behavior on social media is called "social media stalking," which is defined as the obsessive continuous tracking of other people's accounts and actions on social media platforms or going back to a specific user's profile repeatedly. Intentional or accidental, social media stalking behavior may also be driven by curious impulses and the desire to gather a growing amount of personal data about the lives of others via social media platforms.[27]

VIII. **Fake News and Disinformation:** You can compare misinformation to a pandemic. It travels the world at the speed of light and can be fatal when it feeds into erroneous personal prejudice. against every reliable piece of evidence accelerated the spread of false information by broadening its potential distribution and speed. False information generation or the distortion of accurate information can be considered forms of information manipulation, sometimes referred to as "fake news." That does not imply, however, that social media is the only source of this issue. Long ago, there were claims in the mainstream media that claimed aliens had invaded Earth, that Elvis Presley was still alive, and that the Earth was fat. As a result, social media has developed into a potent medium for the spread of false information.[28]

IX. **Hate Speech and Harrasment:** One of the possible reasons of hate speech might be the freedom of expression. As a result, hate speech is seen as a branch of free expression. Hate speech expression has grown popular, and individuals are use this as a quick fix to become well-known right away without having to work as hard. Hate speech puts the boundaries of free speech to the test. Various nations have distinct laws that address hate speech. Hate speech typically contradicts free speech and transgresses a person's fundamental rights the relation between extremism, terrorism, hate speech and hate crime are shown in figure.[29]

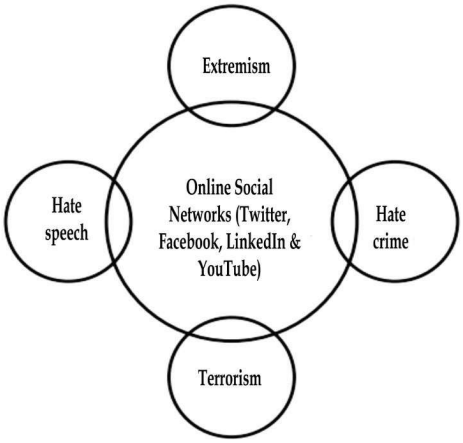

Figure 2: Condemtion of hate speech and harassment

X. **Child Exploitation:** In this type of crimes children are used for criminal purposes through all the social media sites such as Facebook, Instagram, Twitter etc. There are various type of crime such as drug trafficking child pornography, elicit trafficking of child, online grooming 30.

In the context of social media crimes, the monitoring and surveillance of open-source intelligence (OSINT) technologies is essential for locating, stopping, and dealing with online offenders. In order to enable law enforcement agencies, cybersecurity specialists, and other entities keep aware of possible dangers, open-source intelligence (OSINT) technologies play a crucial role in gathering and evaluating publicly available information from social media platforms. These technologies make it possible to monitor internet activity, spot patterns, and spot abnormalities that can point to illegal activity. In order to respond proactively to new threats and stay up to date with the constantly changing environment of social media crimes, ongoing surveillance using OSINT techniques is vital. To guarantee ethical and legal monitoring methods, the use of these technologies must be balanced with privacy and ethical criteria.[31]

- Information is gathered from publicly accessible sources using Open Source SOCMINT (from open sources). via techniques that prevent collecting private information unless the user has not explicitly given his consent to do so (such as using the API (Application Program Interface) to access open-source data from Twitter)[32].

- SOCMINT Focused surveillance, also known as directed surveillance, uses open sources and/or social network analysis to provide a detailed profile of an individual's interests, beliefs, and behaviors SOCMINT Covert human sources, which are applicable and functionally similar to HUMINT, involve the creation of false digital identities, such as fictitious accounts on social media sites like Facebook or Twitter, in order to gain entry to groups or chat rooms.[33]

Collecting information from social media platforms for analysis using open-source intelligence (OSINT) poses a number of challenges and ethical issues that require careful thought. These are as follows.

1. ***Privacy Concerns:*** One of the main difficulties is striking a careful balance between gathering data for security reasons and protecting people's right to privacy. It can be difficult to discern between public and private data, and OSINT operations may unintentionally invade people's privacy.[34]
2. ***Consent and Authorization:*** It is unethical to collect data without people's express consent. Legal and ethical boundaries must be carefully considered in order to strike a balance between the need for information and maintaining users' rights.[35]
3. ***Data Accuracy and Reliability:*** False information may spread quickly on social media and may not always be correct. For intelligence purposes, relying on unconfirmed evidence might result in inaccurate conclusions and affect innocent people.[36]
4. ***Legal Compliance:*** When carrying out OSINT operations, it is vital to observe both national and international regulations. In addition to having negative legal effects, breaking privacy rules or participating in improper data collecting might undermine the validity of the inquiry. A cybersecurity danger that originates from within an organization is known as an insider threat. Data breaches are typically the result of someone who is or was employed by the company, such as an employee, contractor, vendor, or partner, abusing their authorized access to compromise the company's networks, systems, and data. This can happen accidentally or on purpose, and the majority of insider threats are to blame for these breaches.[37]

I. **Advanced Analytics and AI:** By combining AI and advanced analytics into SOCMINT technologies, it will be easier to swiftly evaluate enormous volumes of data and derive insightful information. More precise and effective intelligence may be produced by teaching machine learning algorithms to identify patterns, anomalies, and sentiment. Social media's vast potential offers several benefits, such as the analyst's capacity to conduct a multi-source analysis that will be helpful for both the gathering and information verification. Planning for subsequent intelligence cycles that involve other types of information collection can begin with the data and information intelligence communities obtain through SOCMINT.[38]

II. **Real-time Monitoring and alerts:** There will probably be an increase in demand for real-time monitoring and rapid warnings. Agencies and organizations will look to quickly detect and address any new risks, emergencies, or opportunities on social media platforms. Practically speaking, social networks and information gathered from public sources have merged in the modern environment. Sadly, these platforms have also developed into a focal point for military and social attacks, which makes OSINT most notably Social Media Intelligence (SOCMINT), a crucial tool for deciphering the vast amount of data included in these online environments. OSINT systems are becoming more and more important in the context of cyberdefence for situational awareness, particularly of the cyberspace layer and cyberpersons, as they prepare for the future of cognitive and information warfare.[39]

III. **Global Integration of Threat Intelligence:** SOCMINT may be more closely linked to more extensive threat intelligence systems, fusing social media information with information from other sources to offer a more thorough picture of possible dangers.[40]

RESULT

A systematic review of open-source intelligence (OSINT) and social media intelligence (SOCMINT) showed great strides in advancements in these fields, especially in counterterrorism, cybercrime prevention, and business intelligence. Apart from peer interaction, social media platforms serve as an outlet for rapid dissemination of information and enhancement of corporate communication. However, on the flipside, the study has elucidated that social media has some grave disadvantages like identity theft, phishing scams, cyberbullying, and recruitment by extremists.

Available OSINT tools-Maltego, Webmii, and Tinfoleak-have shown effectiveness in profiling someone's identity and detecting fake accounts; problems remain in data accuracy and privacy issues. The study found terrorism and extremism-commonly identified threats facilitated by social media platforms, which are exploited for radicalization and covert communication. Other emerging issues include cybercrimes, such as revenge pornography, online scams, and hate speech, which will certainly grow and post intractable legal and ethical dilemmas in law enforcement.

A critical finding was the ethical and legal tension between surveillance and privacy rights. SOCMINT aids threat detection, whereas its means, covert profiling and data scraping, usually violate user consent and data protection laws. The study also reveals contradictory theories about OSINT effectiveness; some advocate AI-driven analytics for real-time monitoring; others, however, warn against overreaches and false intelligence. While social media is still essential in intelligence and business, mitigation of the risks it engenders will Paramount require better controlling frameworks, enhanced AI-powered threat detection, and public awareness. Future research should concentrate on situational awareness tooling, which balances security needs with ethical data gathering practices.

DISCUSSION

This study demonstrates that OSINT and SOCMINT are two-edged swords as far as their key roles in counterterrorism, cybersecurity prevention, and business intelligence are concerned, thereby exposing risks such as identity theft, cyberbullying, and extremist recruitment. Tools such as Maltego and Tinfoleak may effectively profile and detect fake accounts, but challenges such as data accuracy and privacy violations remain. Another key issue is the consideration of social media by terrorists and extremists as avenues for radicalization and clandestine communication; with increasing cybersecurity crimes such as revenge pornography and hate speech, they represent huge legal and ethical dilemmas for law enforcement agencies. The main concern remains the conflict between surveillance and privacy rights as illicit profiling and scraping of data, as done in SOCMINT, clash with user consent and laws on data protection. These differences increase tension regarding the efficacy of OSINT, with advocates for AI-enabled and real-time monitoring of online data and critics alerting possible overreach and false intelligence. Looking forward, risk mitigation will depend on both much stricter regulatory frameworks and more advanced AI-based threat detection models, along with increased public awareness. It is possible for future studies to conduct research on how to develop situational awareness observation tools balancing securing needs and ethical data practices. Such studies will no doubt ensure responsible use of OSINT and SOCMINT in an increasingly digitized world.

CONCLUSION

The rapid expansion of social media platforms has revolutionized global connectivity and communication, presenting both opportunities and challenges, particularly in the realm of social\media crimes. This abstract provides an overview of the key subjects, trends, and implications associated with the intersection of criminal activity and social media. The article acknowledges the advantages of social media, emphasizing its role in fostering online communication, community building, and information exchange. It explores the positive aspects, such as peer interaction and business potential, but also delves into the multiple drawbacks, including privacy concerns, identity theft, phishing, and other cyber threats. Open-Source Intelligence (OSINT) is highlighted as a critical tool for collecting and profiling data from publicly available sources, with a focus on social media platforms like Facebook, Twitter, and Instagram. The

objective of the study is to conduct a thorough analysis of recent empirical research on OSINT and cyber intelligence profiling, aiming to identify faults and threats in online social networks for mitigation purposes. The methodology involves a methodical narrative review of the literature, database searches, and a synthesis of results using quantitative and qualitative rating devices. The study reveals advancements in OSINT theories, emphasizing its significance in combating terrorism, recognizing criminal networks, and addressing potential drawbacks and risks. The systematic review produces unexpected results and contradictory theories, shedding light on research problems affecting OSINT. The conclusion emphasizes the continued importance of social media platforms for various purposes and calls for additional research to enhance situational awareness and mitigation measures. The introduction provides a comprehensive overview of social media, its definition, and its impact on global idea exchange. It highlights both positive and negative aspects, acknowledging the benefits of communication and information sharing while recognizing the risks, such as the rapid spread of misinformation. The article then delves into the evolution of social media from a mere service to a platform for interaction and information sharing. The importance of OSINT in government investigations and intelligence gathering is discussed, emphasizing its role in improving communication between businesses and clients. The methodology section outlines the data collection process, including the identification of relevant platforms, OSINT techniques, web scraping, data storage, and ethical considerations. OSINT tools for social media analysis are presented in a table. The section on social media extremism and terrorism explores the use of social media for promoting extreme ideas and terrorist activities. The types of social media crimes commonly faced by users, such as cyberbullying, identity theft, phishing, and more, are detailed. The abstract concludes with a discussion on monitoring and surveillance in the context of social media crimes. It highlights the importance of OSINT technologies for gathering and evaluating information from social media platforms, addressing challenges and ethical considerations in the process. Overall, the abstract provides a comprehensive overview of the complex relationship between social media and criminal activities, emphasizing the importance of research, technological advancements, and ethical considerations in addressing the evolving landscape of social media crime.
